# Regression Statistics Week 09 Memory Recall

### **Problem Statement**

A company sets different LOC rates for a particular project in its eight different modules. The accompanying table shows the numbers of LOC and the corresponding rates.

| LOC            | 420 | 380 | 350 | 400 | 440 | 380 | 450 | 420 |
|----------------|-----|-----|-----|-----|-----|-----|-----|-----|
| Rates (100USD) | 5.5 | 6.0 | 6.5 | 6.0 | 5.0 | 6.5 | 4.5 | 5.0 |

# Regression Statistics

### **SUMMARY OUTPUT**

| Regression Statistics |             |  |  |  |  |  |  |
|-----------------------|-------------|--|--|--|--|--|--|
| Multiple R            | 0.937137027 |  |  |  |  |  |  |
| R Square              | 0.878225806 |  |  |  |  |  |  |
| Adjusted R Square     | 0.857930108 |  |  |  |  |  |  |
| Standard Error        | 12.74227575 |  |  |  |  |  |  |
| Observations          | 8           |  |  |  |  |  |  |

# Week 10 Agenda: ANOVA Analysis of Variance Table

### **ANOVA TABLE Format**

The ANOVA (analysis of variance) table splits the sum of squares into its components.

### **ANOVA**

|            | df | SS | MS | F | Significance F |
|------------|----|----|----|---|----------------|
| Regression | 1  |    |    |   |                |
| Residual   | 6  |    |    |   |                |
| Total      | 7  |    |    |   |                |

### Total sums of squares

Total sums of squares =

Residual (or error) sum of squares +

Regression (or explained) sum of squares

Thus 
$$\Sigma_i (y_i - ybar)^2 = \Sigma_i (y_i - yhat_i)^2 + \Sigma_i (yhat_i - ybar)^2$$

# Today's Agenda

- ✓ Feature...Variable....Factor....component, Vector
- ✓ Why Select, Extract or Rank Feature ??
- ✓ Curse of Dimensionality

✓ Weekly Assignment Discussion

- ✓ Strategies for Feature Selection
- ✓ Identify ANOVA as strategy of Feature Selection

# We need ANOVA Test in Artificial Intelligence for Feature Selection

Feature...Variable...Factor....Component

Alternate words for feature

# Row/column Vector.....Matrices

"Feature" = a component of data

| I       | 2 |
|---------|---|
| you     | 0 |
| upset   | 0 |
| unhappy | 1 |
| puppy   | 1 |
| bear    | 0 |

:

| 0  | 3.29 |           |
|----|------|-----------|
| 23 | -15  | What's is |
|    | 48.3 | important |
| -  | 25.1 | feature?  |
| 6  | 3.82 |           |

# JM1 Data Matrix

10885 Rows x 22 Columns

Dimension d = 22

# ANOVA Why Select Features?? Why Extract Features?? Why Rank Features??

# 1D-10 Positions, Univariate

With 1D feature space there are only 10 possible positions. Therefore 10 data elements are required to create a representative samples which covers the problem space.

Division

1 dimension: 10 positions

1 dime 10 pos

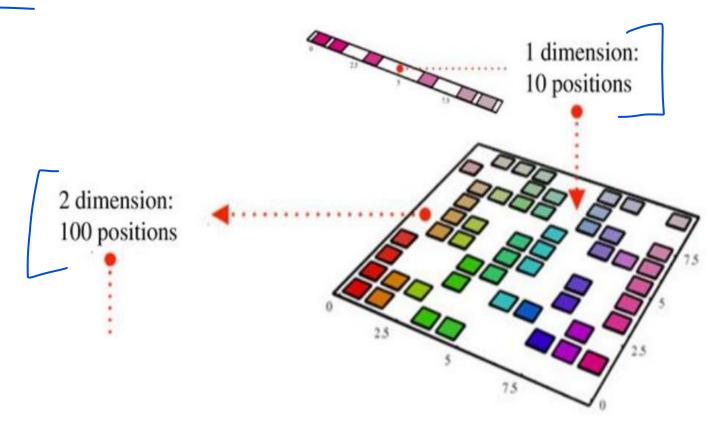

Data/Feature Scale: 0......1 (Normalization)

Data/Feature Scale: 1......10 (un-Normalization)

# 2D-100 Positions, Multivariate

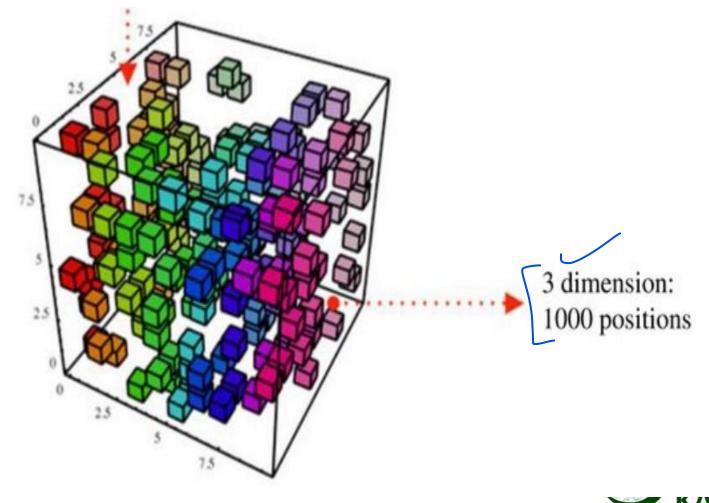

With 2D feature space there are 10<sup>2</sup> = 100 possible positions. Therefore 100 data elements are required to create a representative samples which covers the problem space.

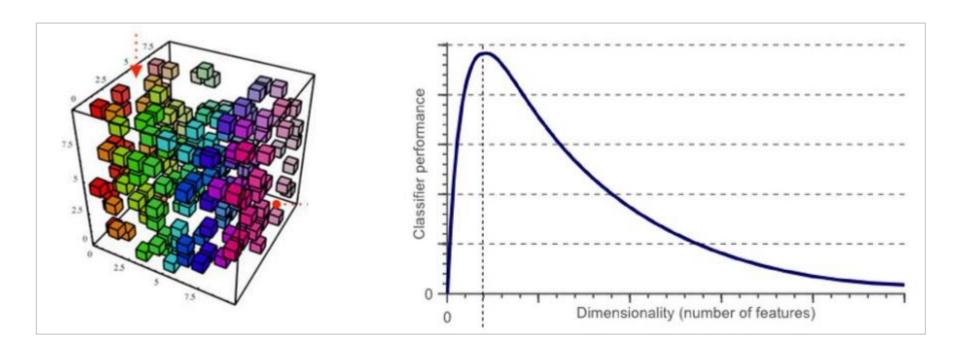

# 3D-1000 Positions, Multivariate

With 3D feature space there are  $10^3 = 1000$  possible positions. Therefore 1000 data elements are required to create a representative samples which covers the problem space.

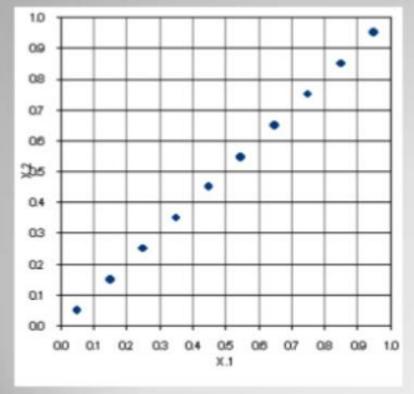

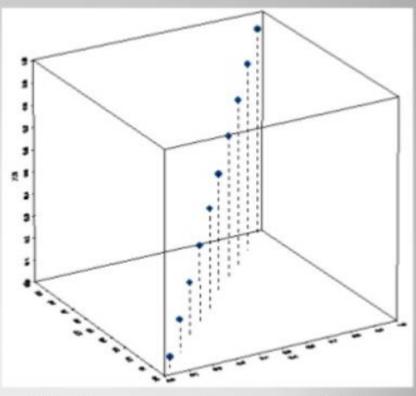

The exponential growth in the required number of data continues to grow indefinitely.

Representation of 10% sample probability space
(i) 2-D (ii)3-D

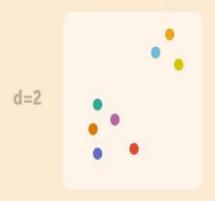

The Number of Points Would Need to Increase Exponentially to Maintain a Given Accuracy.

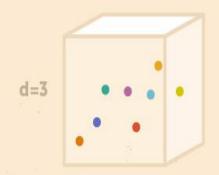

10<sup>n</sup> samples would be required for a n-dimension problem.

**♦**toptal

Curse of DIMENSIONALITY

As the dimensionality of the features space increases, the number Configurations can grow exponentially, and thus the number of configurations covered by an observation decreases.

ChrisAlbon

# How should Model Behave??

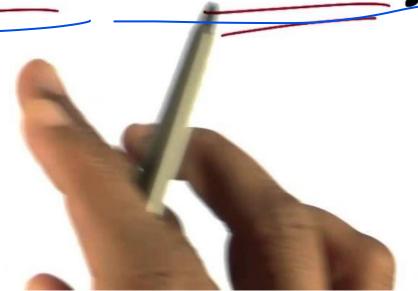

CURSE OF DIMENSIONALITY

AS THE NUMBER OF FEATURES OR DIMENSIONS

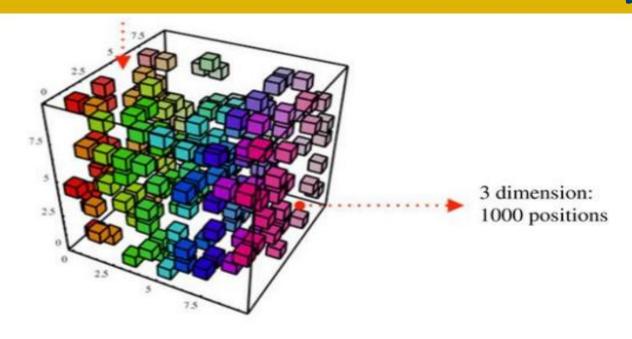

GROWS, THE AMOUNT OF DATA WE NEED TO

GENERALIZE ACCURATELY GROWS EXPONENTIALLY

Generalize/Specialize ???

This mean higher the dimension, (less/more) space the data occupies in the whole space.

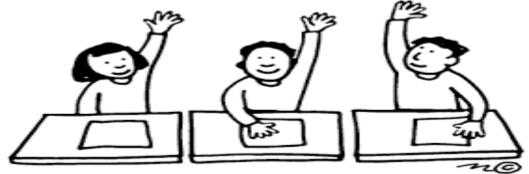

# **Sparse Data**

| Row | Feature with Sparse Data | Feature with Missing Data |
|-----|--------------------------|---------------------------|
| 1   | 0                        | null                      |
| 2   | 1                        | 4                         |
| 3   | 0                        | 3                         |
| 4   | 0                        | null                      |

As the data becomes sparse, the new data is likely to be (further/closer) from train data, requiring much more work to be done for prediction.

I am giving you 5 pictures based on artificial intelligence concepts.

Take Print of each picture, Explore and write at-least 15 technical/Al relevant points that shows your understanding.

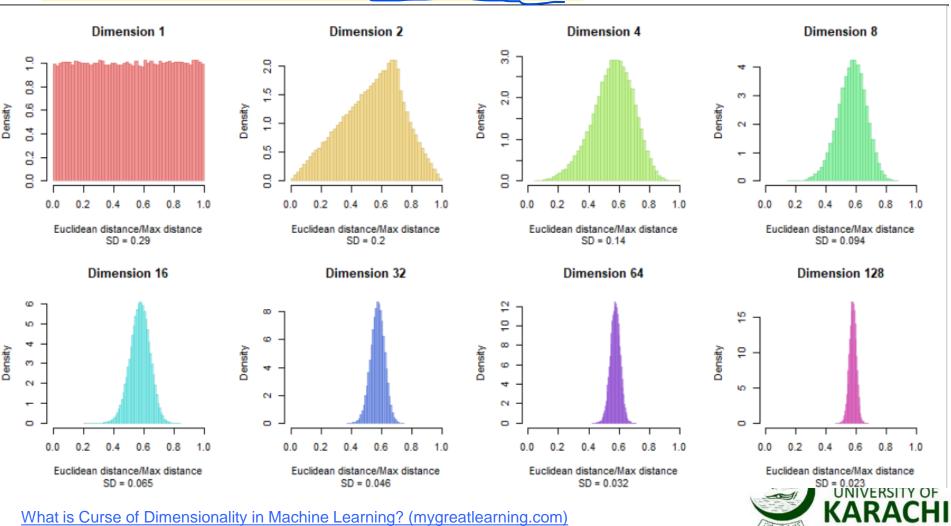

Format: Mainly Handwritten

### Bonus:

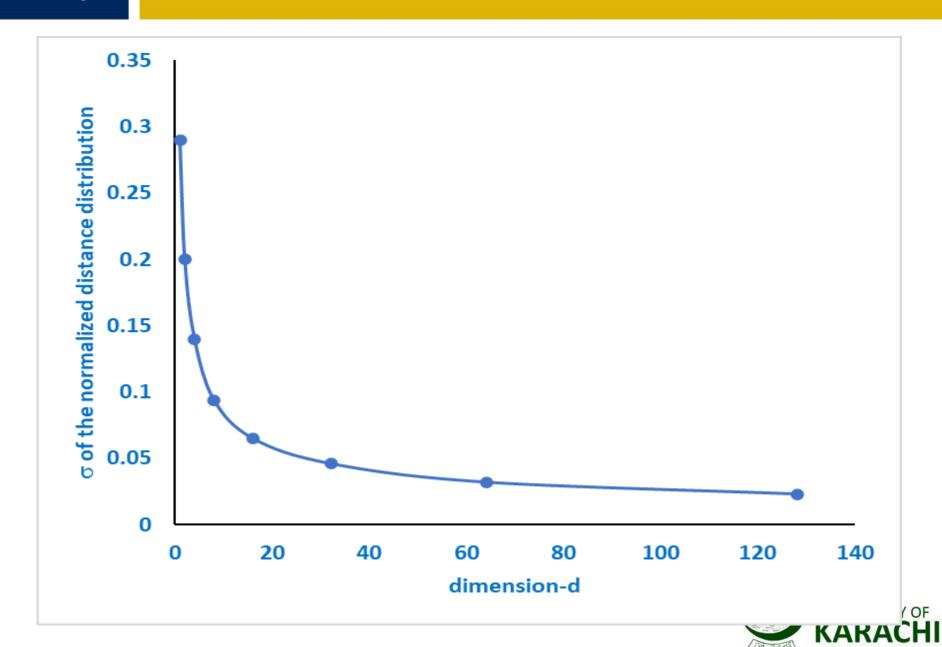

- Attach/support Lab work
- Relevant Toy Example
- Relevant Mathematical Formulas
- Relevant Table

### Density plots and Dimension curse

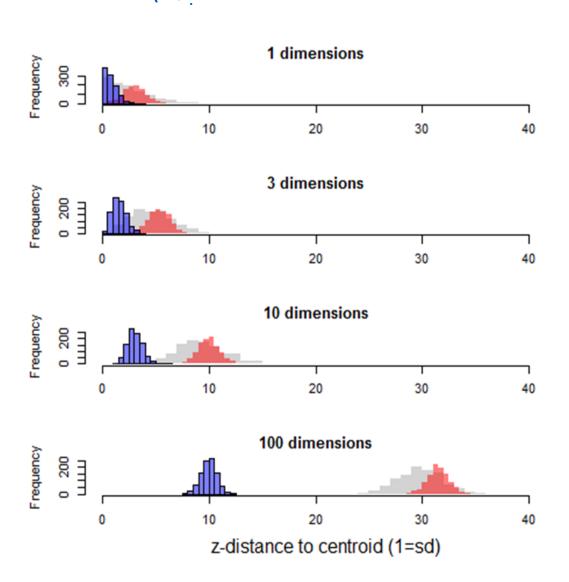

As the number of dimensions increases, we see that the spread of the frequency plot decreases indicating that distances between different samples or points tend towards a single value as the dimension increases.

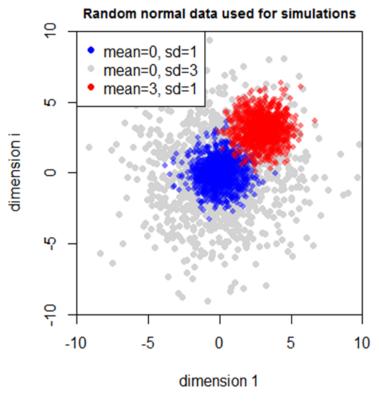

### Standard Deviation and Dimension Curse

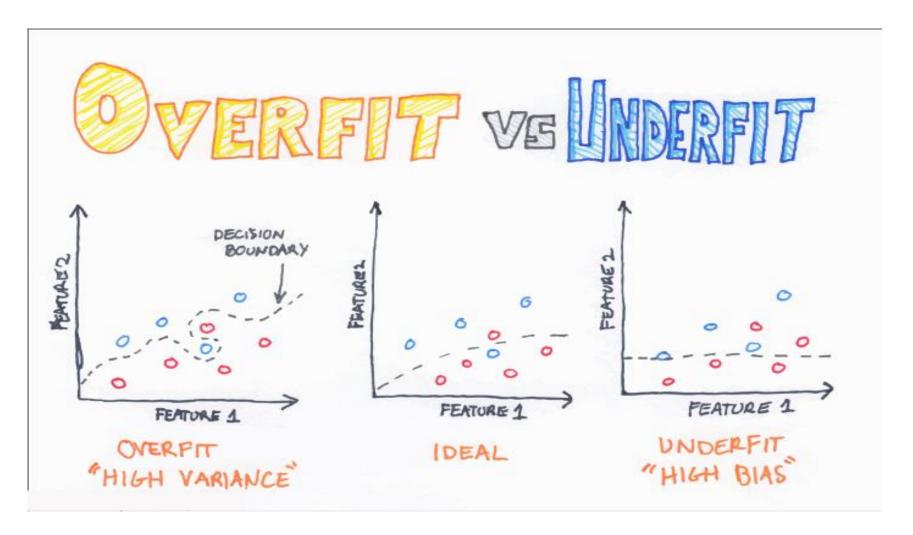

# Higher dimension is Good/bad for Prediction ??

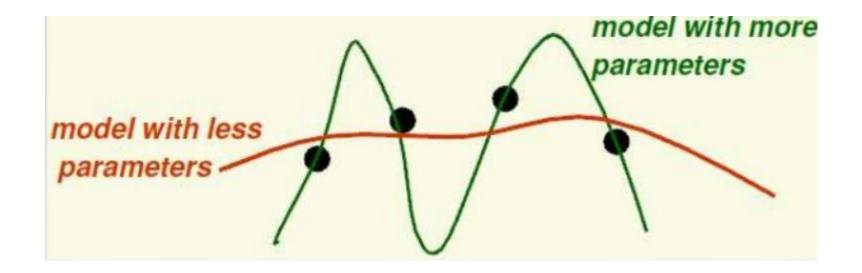

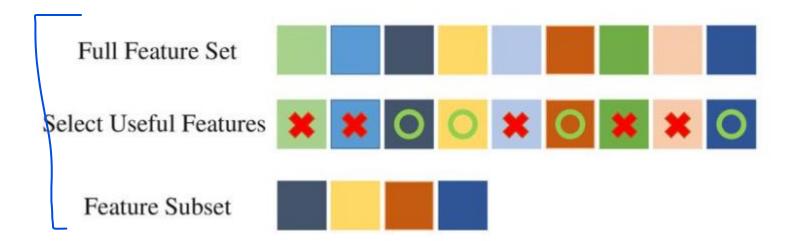

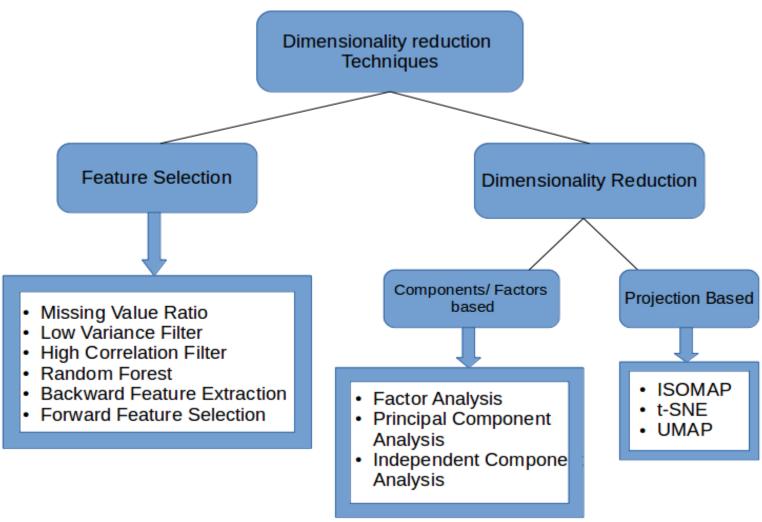

We are still on chasing:
Why ANOVA???
Feature Selection

- ✓ The focus of feature selection is to select a nice subset from the input data.
- ✓ It can make nice predictive accuracy while reducing noise or irrelevant features.

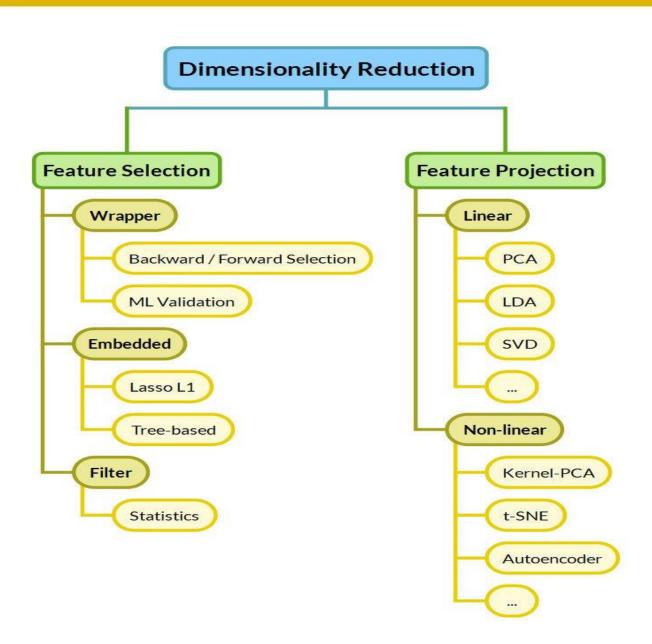

### Feature Selection Strategies-1

# Feature Selection Strategies-2

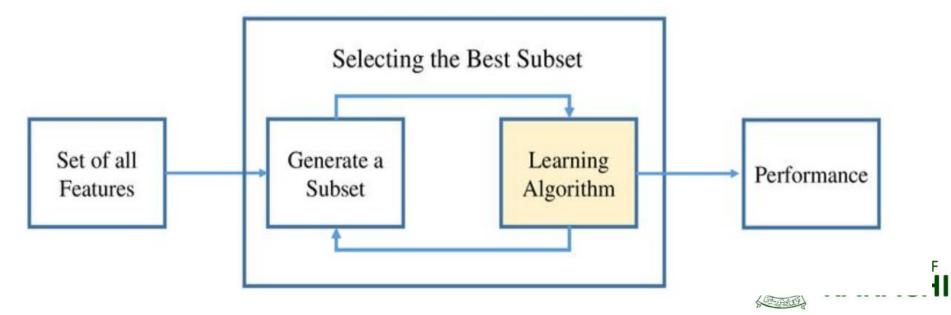

We are still on chasing:

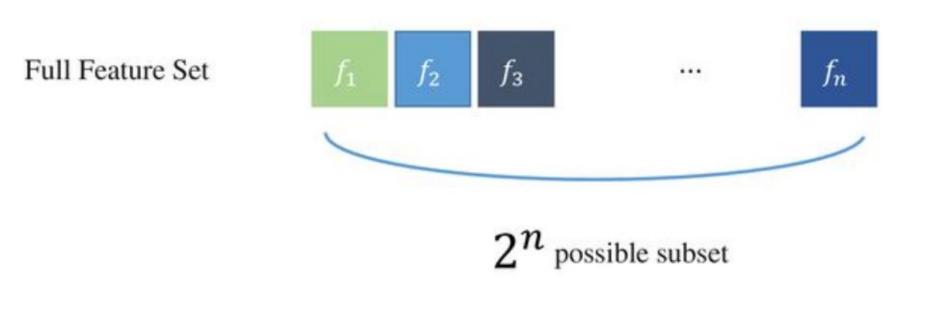

Why ANOVA???

Feature Selection  $\rightarrow$  Wrapper strategy

### Wrapper Concept

- ✓ Feature set search component first generate a subset of features
- ✓ Learning Algorithm acts as a black box to evaluate the quality of these subsets/folds based on learning performance.
- ✓ The whole Process works iteratively until:
  - The best learning is achieved.
  - The desired number of selected feature is obtained.

Unfortunately, If we have n features, the number of possible subsets is 2 to the power n. It is impossible for us to enumerate each of these possible subsets and check which good it is. Therefore, Wrapper methods usually uses the Heuristic Search Algorithm or Sequential Selection Algorithm to obtain the final subset within a reasonable time.

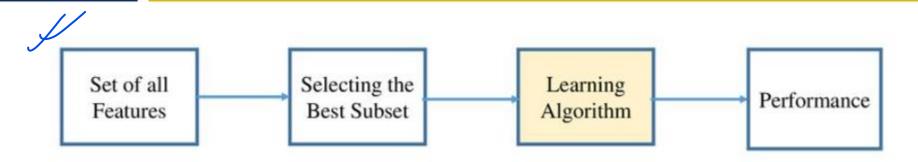

We are still on chasing:

Why ANOVA???

Feature Selection  $\rightarrow$  Filter strategy

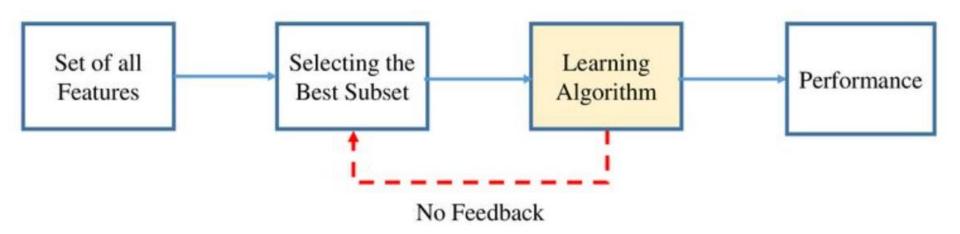

## Filter Concept

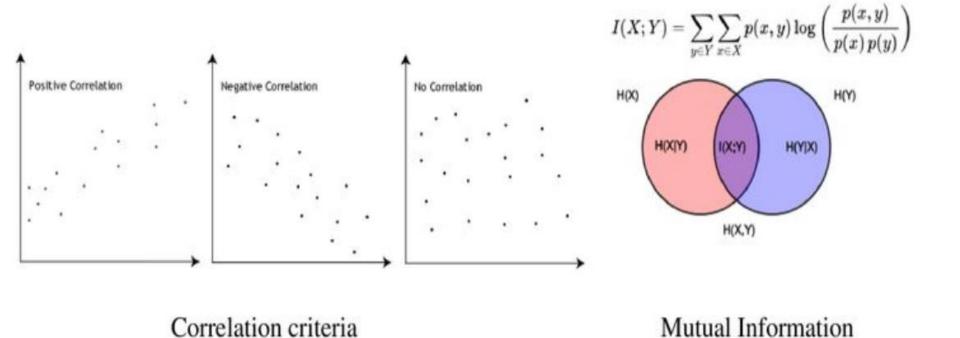

- ✓ Filter methods are independent of any learning algorithm.
- ✓ They rely on statistical measure about data to evaluate performance of each feature.
- ✓ They are more computationally efficient than wrapper methods.

✓ Due to lack of learning algorithm guidance/ feed back in feature selection phase, the selected features may not be optimal for target learning algorithms

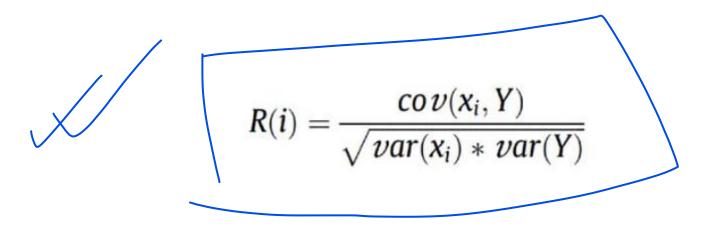

One of the simplest criteria is the Pearson correlation coefficient defined as (1). Where  $x_i$  is the  $i_{th}$  variable, Y is the class labels, cov() is the covariance and var() the variance. Correlation ranking can only detect linear dependencies between variable and target.

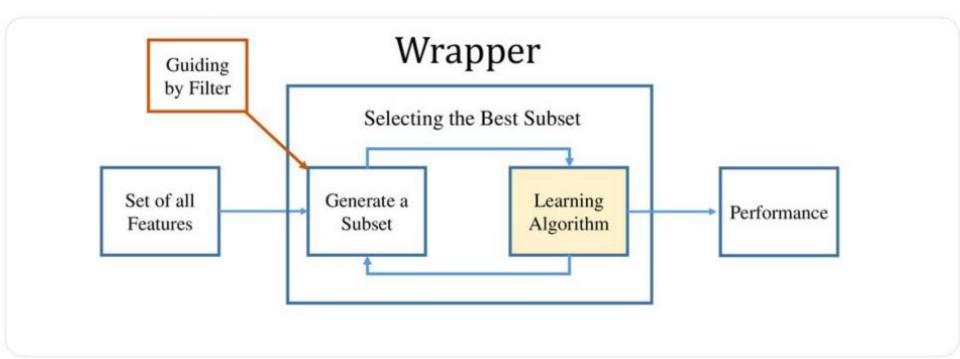

- ✓ Numerical vs. categorical variable
- ✓ Regression vs. class label prediction
- ✓ Variance
- √ Co-Variance
- ✓ Correlation ranking → Detecting Linear Dependencies

One of the simplest criteria is the Pearson correlation coefficient defined as (1). Where  $x_i$  is the  $i_{th}$  variable, Y is the class labels, cov() is the covariance and var() the variance. Correlation ranking can only detect linear dependencies between variable and target.

### Recent Research: Wrapper + Filter

Recently research, It is effective to apply the Filter method when using the Wrapper methods. We can use the filter method when the Wrapper method is initialization phase or reproduction phase. It allows the wrapper to focus on promising features and increase the performance.
